## **DETAILED ACTION**

### ***Election/Restrictions***

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 9-13, drawn to a method of measuring ECG alternans and respiratory frequency, classified in class 600, subclass 513.
- II. Claims 14-20, drawn to a method of measuring ECG alternans indicative of cardiac instability, classified in class 600, subclass 508.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the combination does not require obtaining signals from 12 leads. The subcombination has separate utility such as a system to measure ECG alternans indicative of cardiac instability by itself, not requiring determining a respiration frequency from the maximum spectral density of the first eigenvariable from the depolarization portion of the cardiac cycle.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

A telephone call was made to Joseph Kuborn on 7/21/05 to request an oral election to the above restriction requirement, but did not result in an election being made.

Art Unit: 3762

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).
